WILDLIFE TRAVEL

Cyprus 2014

Cyprus species lists and trip report, 12th to 21st March 2014

#	DATE	LOCATIONS & NOTES
1	12 th March	Afternoon arrival and transfer to the Aphrodite Beach Hotel.
2	13 th March	Baths of Aphrodite, walk round to Fontana Amorosa, then back to the hotel along the coast
3	14 th March	Pegeia Forest. Kritou Terra
4	15 th March	Stroumpi. Monastery of Agios Neophytos. Tombs of the Kings. Paphos headland
5	16 th March	Hillsides towards Neo Chorio and Latchi
6	17 th March	Paphos Forest: Peristerona, Stavros tis Psokas
7	18 th March	Droutia area
8	19 th March	Minthis Hill. Episkopi. Aranita. Mandria beach
9	20 th March	Smygies to Neo Chorio and back to hotel
10	21 st March	Return to UK.

LIST OF TRAVELLERS

Leaders

Yiannis Christofides

Philip Precey

Cyprus species lists and trip report, 12th to 21st March 2014

12th March. Arrival. After some fun and games along the way with a rattling plane at Gatwick and fog at Luton we all eventually arrived at Paphos Airport in the late afternoon where we met up with Yiannis and Lambros, our driver and transferred to the hotel at Aphrodite Beach, just north of Latchi on the eastern edge of the Akamas Peninsula, our home for the next ten nights.

13th March. Baths of Aphrodite. Today, our first introduction to the countryside and flora of Cyprus came whilst walking some of the coastal path around from the Baths of Aphrodite towards Fontana Amorosa, just up the coast from the hotel. But first we had to get to the 'start' of the walk!

The botanical garden at the Baths of Aphrodite was a great introduction to some of the endemic plants of the island, including some real specialities that we won't see elsewhere on our itinerary: the impressive *Euphorbia veneris* more normally found high up in the Troodos range, and the lovely *Sideritis cypria*, only found on the northern, Kyrenia range.

From here we visited the Baths themselves, a shady pond where myth would have us believe Aphrodite bathed after her exploits: here we found Maidenhair Fern, the leaves of Brookweed along the stream and some very luxuriant fig trees. Beyond the Baths, the rocky hillsides were home to plenty of flowering *Cyclamen persicum* and the Turban Buttercup *Ranunculus asiaticus*, as well as two species of *Bellevalia* and our first orchids, in the form of *Ophrys flavomarginata* and *O. umbilicata*, the yellow *O. sicula* and *O. elegans* with its swept back wings. We also learned more about the 'interesting' (for which, read incredibly complex) geology of the island.

14th March. Pegeia Forest. Today dawned bright but windy, although as we headed over to the other coast, the wind calmed down and the sun warmed up.

Arriving at the forest, it was as much as we could do to make it out of the car park, where we were all enjoying the orchids: *Anacamptis syriaca*, *Ophrys levantina*, *O. sicula*, *O. elegans* and *O. cinereophila* were all within ten paces of the bus, keeping the botanists and photographers busy!

Low-growing bulbs included abundant white *Ornithogallum pedicellare* and the yellow *Gagea peduncularis*. A patch of mossy ground with the leaves of the autumn-flowering buttercup *Ranunculus bulbatus* was also home to the tiny fronds of Small Adder's Tongue *Ophioglossum lusitanicum*, a winter 'flowering' fern which was surprisingly common in its favoured micro-habitat.

Exploring deeper into the forest, the limestone outcrops here have a series of vernal rock pools, home to a special suite of plants, including the little red succulent *Telmisia microcarpa*, the water crowfoot *Ranunculus peltatus*, the floating leaves of Mudwort *Limosella aquatica* and the green 'hair' of Horned Pondweed *Zannichellia palustris*. Nearby we found the tiny sand crocus *Romulea ramiflora* and several spikes of the lovely delicate *Serapias aphrodite*, an endemic not just to Cyprus but to this tiny corner of the Akamas peninsula itself!

Birds were most obvious by their relative absence, with just Sardinian Warblers and a handful of finches to show for the day, but butterflies were on the wing during the day, with Orange Tip, Red Admiral and Painted Lady all familiar species from home, but more exciting were the endemic Paphos Blue, a couple of bright yellow Cleopatra and a fast-flying Swallowtail.

Heading back towards the picnic site we also found several Crown Anemones *Anemone coronaria* in flower and a good population of *Ophrys morio*, while nearby a single tiny flower of *Gagea fibrosa* was found, a plant that normally flowers in February.

Having made good time during the morning, we made an unscheduled stop at the village of Kritou Terra, where we wandered along the quiet lanes, finding one of the island's only two populations of *Fritillaria persica*, along with some lovely Giant Orchids *Himantoglossum robertianum*, a spike of *Arum hygrophilum* and a noisy Cetti's Warbler.

15th March. Paphos. A day delving into Cyprus's history, which seems almost as complicated as its geology! But first, a quick stop near the village of Stroumpi, where a small population of *Tulipa agenensis* seems to be flourishing on the edge of the cultivated fields: a lovely little red tulip, in a rather precarious situation, but one that definitely seems to be having a good year.

And so to our history lessons... we started at the monastery and hermit's cave of Agios Neophytos, home to some impressive cave paintings and an unfortunate saint's skull. We then moved on to the Tombs of the Kings, where the Ptolemaic rulers of the island were buried, and where the sandy, rocky upper beach revealed its particular plant

Cyprus species lists and trip report, 12th to 21st March 2014

specialities: *Centaurea aegialophila*, *Medicago marina* and the tiny *Papaver cypricum* amongst them, as well as a good number of Schreiber's Fringe-footed Lizards, a couple of impressive Starred Agamas and an Isabelline Wheatear down by the shore.

To learn more about the lifestyle of Paphos's ancient upper class, we travelled to the Paphos headland with its fantastic mosaics, roman amphitheatre and byzantine 'castle of forty columns'. Alongside the history, we enjoyed some birding. An immature Shag was on rocks in the harbour, while around the archaeological site were four Wood Larks, a single Hoopoe and a handful of Northern Wheatears, with a pair of Isabelline Wheatears posing alongside. On the rocky shore we found a Little Egret, paddling through the pools.

16th March. Hillsides above the hotel. Before breakfast, at least four Black Francolins could be heard singing from the nearby hills and fields... but always just out of sight. Patience is a virtue, and eventually we were lucky to find a male singing from a small rise in a field just up the road, as we made our way into the lanes up towards Neo Chorio.

During the morning, we walked up through the lanes and then along the ridge towards Latchi, before heading back to the hotel along the road. We found plenty of orchids along the way, amongst the abandoned olive groves and rough fields. A single small rough field was home to an amazing mix of Tongue Orchids, with four species of *Serapias* growing side by side: *Serapias orientalis*, *S. levantina*, *S. bergonii* and the delicate local endemic *S. aphrodite*. Down in the lowest grove we found a handful of the large, yellow *Orchis punctulata* surviving in the edges of a field, where once a very strong population grew, growing alongside the giant orchid *Himantoglossum robertianum*. *Ophrys* orchids during the morning included velvety black *O. morio*, *O. umbilicata* (with the pale pink sepals and barrel-shaped lip), *O. astarte* (very like *umbilicata* but with green sepals, and previously called *Ophrys attica*), *O. flavomarginata* (very common, with the more flared lip and yellow margins) and *O. sicula* (the yellow one). Highlight of them all, however, were a small population of the handsome black and white and purple endemic *Ophrys kotschyi*. A wonderful variety in a relatively small area, although how long will they all survive here, with signs of yet more development of housing in these rural villages.

Coming down from the ridge, we explored another area of temporary pools and limestone 'pavement' just off the road. Here we were pleased to find another population of *Serapias aphrodite*, looking particularly dainty amongst the rocks here. In the pools themselves and the damp ground around them we found plenty of *Telmis microcarpa*, *Sedum caespitosum* and the Red Data Book plant *Crassula alata*. The pools were home to plenty of tadpoles and a few water beetles, but most exciting of all were the bizarre Clam Shrimps, members of an ancient and increasingly endangered group of crustaceans known as the Branchiopods, which are specialists of temporary pools which dry up in the summer.

17th March. Troodos Foothills. Today we headed for the cool air and the endemic flora of the mountains, with Lambros safely tackling the hair pin bends of the Troodos Foothills, through the Paphos Forest.

We visited the small village of Peristerona, where we explored the rocky hillside, finding Ground Pine *Ajuga chamaepitys*, a dead Coin-marked Snake on the road and fly-pasts by several very showy Eastern Festoons, and visited the nearby Byzantine Museum of the Bishporic of Arsinoe, home to some spectacular icons and a 1100 year old olive tree!

Crossing from the limestone to the igneous rocks, the vegetation changed from soft fields with Carob and Almonds to a forest of *Pinus brutia* with an understorey of (endemic) Golden Oak *Quercus alnifolia* and Eastern Strawberry Tree *Arbutus andrachne*. Our first roadside stop yielded the endemic *Orchis troodii*, beautiful creamy yellow *Dactylorhiza romana* and some tiny botanical highlights in the form of more *Ophioglossum lusitanicum* under a cistus bush and the even-more- tiny and almost un-noticeable *Minuartia montana*, together with the pink, endemic *Thymus integer*.

We stopped for lunch near the Mouflon enclosure at Stavros tis Psokas, passing the leaves of the endemic *Cyclamen cypricum*, the leaves of *Platanthera holmboe* (yet another endemic orchid, although this one is probably a month away from flowering), the beautiful *Vicia cassia* and a couple of noisy Coal Tits (an endemic Cypriot subspecies, of course) on the way.

Our afternoon walk looped around the top of a hill through the pine forest: here we found another beautiful *Vicia*, the yellow and purple *V. lunata*, the tiny *Vicia lathyroides*, a couple of impressive *Romulea tempskyana* and a big patch of *Teesdalia coronopifolia*.

Cyprus species lists and trip report, 12th to 21st March 2014

A couple of roadside stops revealed the distant Cyprus Cedars, and some wonderful rock plants, in the form of *Arabis purpurea*, *Turritis laxa* and *Anagallis lusitanicus*, before we headed back to Latchi, under skies heavy with the grey clouds of Saharan dust which has been blown across by the winds from the south.

18th March. Droutia. With blue skies and sunshine accompanying us for the day, we walked the lanes around the hilltop village of Droutia.

Amongst the African rocks we found the lovely *Vicia cyprica* in flower. The nearby field was a little disappointing, with just a handful of *Ophrys sicula* and *Ophrys cinereophila* amongst the rather stunted *Anacamptis syriaca*. At least five Blue Rock Thrushes were flycatching from the enormous rocks, and amongst them was a real surprise in the form of a female Rock Thrush, an apricot-bellied bird with a lovely orange tail that she fanned when in flight. Nearby, a male Cyprus Wheatear appeared briefly, also fresh in, while overhead a group of Common Swifts were joined by at least one Alpine Swift.

Back to the orchids, and along the way we found some very fresh *Anacamptis laxiflora* in a damper field, a couple of impressive spikes of *Orchis italica*, a single spike of Dense-flowered Orchid *Orchis intacta* and at least two species of Serapias, as well as abundant *A. syriaca* and a whole range of Ophrys: *Ophrys cinereophila*, *O. sicula*, *O. morio*, *O. umbilicata*, *O. flavomarginata* and *O. astarte*. At the end of the walk we found one new Ophrys: *O. israelitica*, a large fusca-like flower but without the V-shaped groove in the throat.

A couple of tree frogs posed in a bush, while a small stream crossing the path was home to Green Toad, with a string of toad spawn and two adults calling from under a big overhanging rock in the stream bed. Nearby, a male Southern Skimmer was zipping about; later on, a male Vagrant Emperor crossed in front of us, another migrant from North Africa, helped this way by the recent winds from the south.

An adult Bonelli's Eagle soared overhead at lunchtime, preceded by three Steppe Buzzards on their way north and a single Long-legged Buzzard lingering over the hillside. At the top of the hill we found a group of at least three Great Spotted Cuckoos causing some consternation amongst the local Magpies. Later, on the edge of the village, we found a male Semi-collared Flycatcher in some oak trees, together with a female of presumably the same species.

19th March. Minthis Hill, Episkopi, Anarita and Mandria Beach. A long day, visiting various sites around Paphos. We started with a hilltop stop just near the golf resort at Minthis Hill. Here we found our first *Ophrys iricolor*, with the lovely cherry-pink underside to the lip, alongside plenty of other commoner Ophrys. A male Spectacled Warbler was singing from the dense bushes, while a female Eastern Subalpine Warbler slipped quietly through and the usual Sardinian Warblers rattled about.

From here we moved on to the Environmental Education Centre at Episkopi, where we investigated the displays, learning more about the wildlife of the island, and had a look at the newly planted botanic gardens. The nearby African limestone rock is home to a pair of Peregrines, and some of us saw one leave the rock, before circling high overhead. There were also plenty of Jackdaws and a single Blue Rock Thrush, with *Verbascum levantinum* growing on the cliff face and both *Polypodium cambricum* and *Asplenium ceterach* in the cracks.

Lunch was along a nearby shady section of river in the valley bottom, with Cyprus Water Frogs, *Alnus orientalis* and fresh oranges scrumped from the nearby orchards by Lambros.

Onwards, and upwards, to the dry hillsides around Anarita where we went on a wheatear hunt. And a very successful one: at least three Eastern Black-eared Wheatears and maybe ten Northern Wheatears were seen before we found the main target of our search, a male Finsch's Wheatear, just finishing his winter season here before heading back up to the highlands of Turkey to breed. A male Pallid Harrier slipped by almost unseen, a couple of Great Spotted Cuckoos were chuckling around the track and a Woodchat Shrike was busy chasing Corn Buntings off from their favourite thistle-top perches.

And then it was down to the beach at Mandria, where we found something for everyone: the botanists enjoyed an array of coastal plants including *Matthiola tricuspidata* and *Anthemis tomentosa*, butterflies ranged from a posing Swallowtail to a tiny African Grass Blue and our first Mallow Skipper of the trip, and for the birders there was a recent fall of wagtails to enjoy, including Black-headed Wagtails on their way to Greece and the Balkans, a couple of Blue-headed Wagtails heading to Central Europe, a male Grey-headed Wagtail on his way to Scandinavia and a couple of 'dombrowski' intergrades making their way to Romania or the Ukraine: quite a multinational bunch!

Cyprus species lists and trip report, 12th to 21st March 2014

20th March. Smygies and Neo Chorio. The early risers were rewarded with the best views so far of Black Francolin in the fields just up the road, with the displaying male finally succeeding in attracting a female.

After breakfast, we spent the day walking gently down from the ridge of the Akamas, above the Smygies picnic site, to the hotel, stopping en route for a taverna lunch in the lovely village of Neo Chorio.

But before the walk proper, we drove a bit further up along the trail to a sunny hillside where a little searching revealed good numbers of a beautiful red tulip, the recently discovered population of *Tulipa orphanidea*.

Back at the start of the walk, an outcrop of serpentine rock was the habitat for several Cypriot endemics associated with this rock: *Alyssum akamasicum*, *Thymus integer* and *Centaurea veneris*, with a male Cretzschmar's Bunting singing nearby giving us brilliant views, swiftly followed by a male Cyprus Warbler, a real surprise so far west on the island, where Sardinian Warbler has pretty much replaced the endemic species.

Lower down, under the pines we found the tiny *Gladiolus triphyllus* (another endemic, of course). But the real stars of the day were the orchids: new species came in the form of some fresh *Ophrys bornmuelleri*, the endemic *O. lapethica* just about to go over and the last few flowers of *Orchis sezekiana*.

The walk through the fields back to the village revealed a nice plant of Venus's Looking-glass, plenty of lizards scuttling away at the verges and on the walls, and a group of about five very confiding Cretzschmar's Buntings feeding just outside the village.

21st March. Aphrodite Beach and home... All too soon, our ten days has come to an end! One last breakfast on the terrace, overlooking the Mediterranean, and we had to bid farewell to Gregoria and the team at Aphrodite Beach and headed back to Paphos and our flights home.

CYPRUS 2014

A gallery of Philip's photos from the trip can be seen at
<http://www.flickr.com/photos/wildlifetravel/sets/72157642307719784/>

Top: One of Aphrodite Beach's lovely Savigny's Tree Frogs: very noisy neighbours!
First row, l to r: *Fritillaria persica*, Paphos Blue on *Ophrys morio* and *Ranunculus asiaticus*.
Second row, l to r: the delicate *Serapias aphrodite*, the newly-christened *Ophrys aphrodite* and *Orchis troodii*, three of Cyprus's endemic orchids
